

Practice 1

```
load carsmall;  
% cars = importdata('carsmall.mat')
```

What are the mean, standard deviation and median of Acceleration?

```
%
```

From MPG (Miles Per Gallon) consumption calculate LPHKM (Liter Per Hundred KiloMeters), if

- 1 gallon = 3.79 liter
- 1 mile = 1.61 kilometers

Hint: element-by-element operations are

.*	multiplication
./	division
.^	exponentiation

```
% LPHKM =
```

Round it to 1 decimal place:

```
%
```

Which car has the highest consumption? Use the 'Model' character variable to get the name of the car.

```
%
```

Count the number of cars with LPHKM > 15 liter. Whats the relative frequency of them?

```
%
```

Investigate consumption, conditional to number of cylinders with a boxplot.

```
%
```

Plot a probability histogram on Acceleration. Does it look normally distributed?

```
%
```

Try to fit a PDF on the histogram. (See also **dfittool**)

```
%
```

Plot the Empirical CDF of log(Weight). Also fit an appropriate theoretical CDF.

%

Make a frequency table from the 'Origin' of cars.

%

Plot a barplot.

%
